1 General Information

1.1 Description

Thank you for choosing the **optris® PI NetBox**.

The optris PI NetBox is a miniaturized PC which expands the optris PI/Xi series to a stand-alone solution with remote access via GigE and so allows greater distances between process (IR camera) and process monitoring (PC).

The NetBox works with a Windows 10 operating system that allows the user to install additional software.

The housing of the NetBox is made of anodized aluminum – the optional NetBox protection housing supports the usage in industrial environments (IP65/ NEMA-4 rating).

Read the manual carefully before the initial start-up. The producer reserves the right to change the herein described specifications in case of technical advance of the product.

This operator's manual applies to the PI Netbox from version **OPTPINB2xxxxxx**. You will find the note **NB2** on your Netbox and on the recovery stick.

1.2 Warranty

Each single product passes through a quality process. Nevertheless, if failures occur please contact the customer service at once. The warranty period covers 24 months starting on the delivery date. After the warranty is expired the manufacturer guarantees additional 6 months warranty for all repaired or substituted product components. Warranty does not apply to damages, which result from misuse or neglect. The warranty also expires if you open the product. The manufacturer is not liable for consequential damage or in case of a non-intended use of the product.

If a failure occurs during the warranty period the product will be replaced, calibrated or repaired without further charges. The freight costs will be paid by the sender. The manufacturer reserves the right to exchange components of the product instead of repairing it. If the failure results from misuse or neglect the user has to pay for the repair. In that case you may ask for a cost estimate beforehand.

1.3 Scope of Supply

- NetBox incl. Micro SDHC card (32 GB)
- Power supply (100-240 VAC / 24 VDC)
- HDMI cable (Micro HDMI to HDMI/ 1,5 m)
- Ethernet cable, 1 m
- System recovery stick (USB/ 8 GB)
- Rail mount adapter
- Operators manual

1.4 Maintenance

The housing of the NetBox can be cleaned with a soft, humid tissue moistened with water or a water based cleaner.

Never use cleaning compounds which contain solvents. Take care that no moisture infiltrates into the housing.

1.5 Cautions

Take care that no foreign substances penetrate into the venting slots of the NetBox.

In case of problems or questions which may arise when you use the NetBox, please contact our service department.

Please use only the threads in the housing or the supplied rail mount adapter for mechanical installation of the NetBox.

Avoid mechanical violence – this may destroy the system (expiry of warranty).

2 Technical Data

2.1 General Specifications

Operating temperature	0...50 °C
Storage temperature	-20...75 °C
Relative humidity	10...95 %, non-condensing
Material (housing)	Anodized aluminum
Dimensions	113 mm x 57 mm x 47 mm (L x W x H)
Weight	385 g
Vibration	IEC 60068-2-6 (sinus shaped) IEC 60068-2-64 (broadband noise)
Shock	IEC 68-2-27 (25 G and 50 G)
Operating system	Windows 10 Enterprise

2.2 Electrical Specifications

Power supply	8...48 VDC or Power over Ethernet (PoE+ (at least IEEE 802.3at))
Power consumption	10 W (+ additional 2,5 W for IR camera)
Cooling	active via two integrated fans
Board	COM Express mini embedded board
Processor	Intel Atom® E3950 Quad Core 1.6/ 2.0 GHz (Turbo)
Hard disc	32 GB SSD
RAM	4 GB (DDR2, 533 MHz)
Ports	3x USB 2.0/ 1x Mini-USB 2.0 Micro-HDMI Ethernet (Gigabit Ethernet)
Extensions	Micro-SDHC- or SDXC-card

3 Installation

3.1 Mounting

The NetBox can be mounted easily on a DIN rail (TS35) according EN50022 using the supplied rail mount adapter. For this purpose please screw the 4 screws (M4) into the designated holes on the upper side of the NetBox housing. Now you can place the rail mount adapter on the housing and fix it with the 4 nuts. On the bottom side of the NetBox housing you will find 4 holes M2,5 which also can be used for mounting.

Figure 4: Protective housing with power supply [Part-No.: ACPINBPHPS]

Figure 5: IR camera with NetBox inside CoolingJacket Advanced for ambient temperatures up to 315 °C

3.4 SD Card

The NetBox will be delivered with a 32 GB Micro SDHC card which is already installed on the unit. If required, you can exchange this card.

The NetBox is supporting Micro SDHC and Micro SDXC cards.

To remove the card please take a ball pen or similar and push onto the card from outside carefully. Please take care when you insert a card that it is placed correctly into the according guide slot.

3.5 Mini-USB Socket

With the Mini-USB socket you can get a direct access to the IR camera from a separate PC without changing cables on the NetBox.

For this purpose, the camera needs to be connected to the USB 3.0 socket.

3.6 Power Supply

For powering the NetBox you either can use the supplied power adapter or a suitable industrial power supply with a voltage output between 8 VDC and 48 VDC [**► 2 Technical Data**].

Alternatively, the NetBox can also be powered via the Ethernet cable (PoE – Power over Ethernet).

For this purpose, a PoE injector is needed (**Part-No.: ACPIPOE**)¹⁾.

¹⁾ For usage of the NetBox together with the high temperature Ethernet cables we recommend the following PoE components instead of ACPIPOE: Trendnet TPI-115GI or Netgear GS510TLP.

4 Operation

The NetBox can be used in following operation mode:

- Stand-alone operation with an IR camera

The NetBox has a green status LED that shows the operating status. If the LED lights up, the Netbox is supplied with power (via power pack or PoE) and is ready for operation.

4.1 Stand-Alone Operation

As a stand-alone PC the NetBox can expand an IR camera to an autonomous system. For this operation mode you should connect a monitor with a HDMI input and a USB keyboard to the NetBox. If your monitor has only a DVI input please use a customary HDMI to DVI adapter. In addition the system can also be controlled via a remote access over an Ethernet connection. **[► 4.3 Remote Access to the NetBox (NetBox Utility)]**

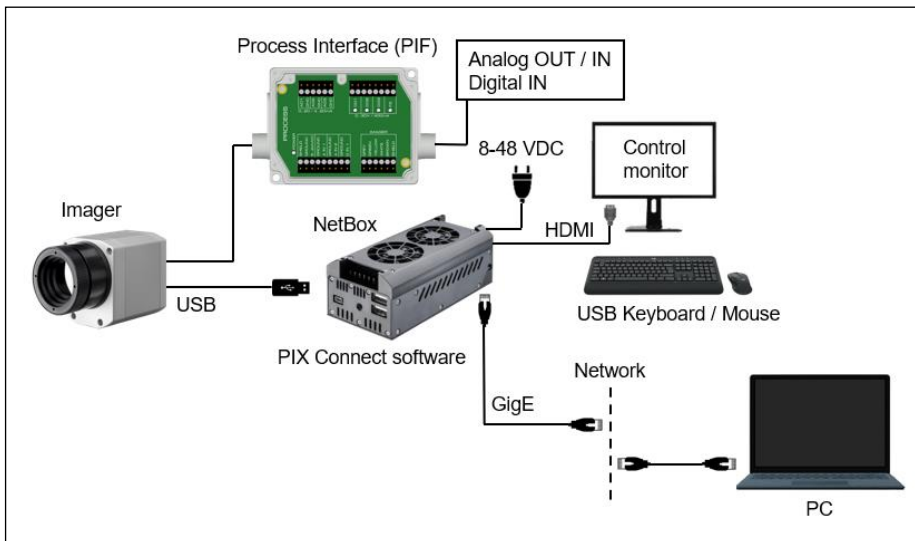

Figure 6: Stand-alone operation with remote monitoring via GigE network/ NetBox powered via power supply

After booting the NetBox the **PIX Connect** software starts automatically. If a PI/Xi is connected the first time to the NetBox the software will ask you for the calibration files.

If you connect the NetBox to the Internet using the Ethernet connection the calibration files will be downloaded automatically. Otherwise you can load the calibration files also manually via the menu **Tools/ Extended/ Reimport calibration files** (from an USB stick e.g.).

4.2 Network Settings

Please connect your imager with the supplied USB connection cable with the NetBox. Please connect your PC with an Ethernet cable with the NetBox. Now connect the power supply to the NetBox and to the mains. The NetBox will start to boot the system and should be ready to use after 1-2 minutes.

You can check the status with the LEDs. At proper functioning now LED should light up.

Figure 7: Ethernet direct connection (point-to-point connection)/ NetBox powered via power supply

If you use a PoE injector the power supply for the NetBox is not needed. In this case please connect the PoE injector as shown in the drawing below.

The used Ethernet cables should be at least category 5 cables (Cat-5 according ISO/ IEC 11801).

Figure 8: Ethernet direct connection (point-to-point connection)/ NetBox powered via PoE injector

Connection to the NetBox

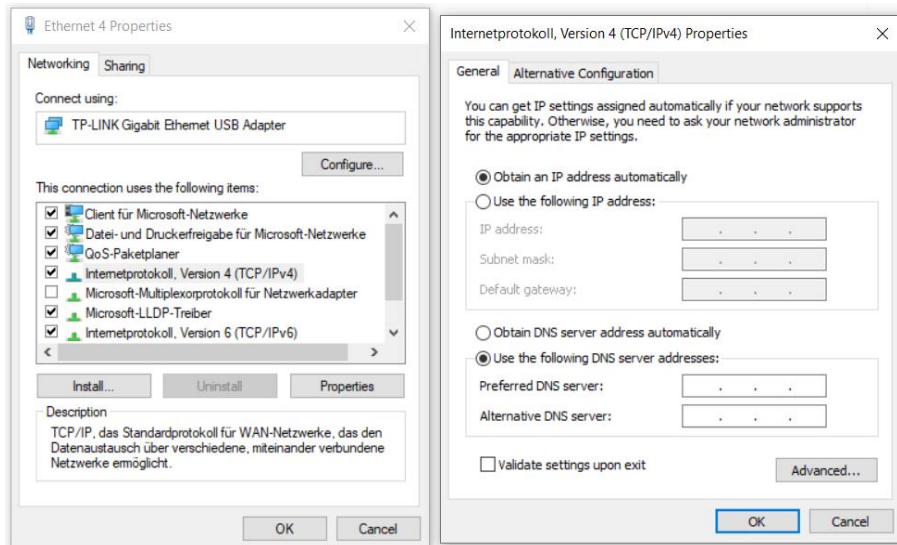

The communication with the NetBox is done via the TCP/ IP protocol (**T**ransmission **C**ontrol **P**rotocol/ **I**nternet **P**rotocol). The NetBox can get its IP address (**I**nternet **P**rotocol address) either from a DHCP server or it can work with a fixed IP address.

On a direct connection to a PC both, the NetBox as well as the PC must use a fixed IP address because no DHCP server¹⁾ is available here. The NetBox is using in this case the IP address **192.168.0.100**. On your PC

you have to do the following settings once (depending on the operating system the procedure can differ from the here shown – the following description refers to a Windows 10 system).

¹⁾ DHCP – **D**ynamic **H**ost **C**onfiguration **P**rotocol: allows the automatic integration of a computer into an existing network.

1. Go to **Settings\ Network and Internet**
2. Click on **Ethernet** in the left menu page
3. Click on **Change adapter options**
4. Right-click on your connection and go to **Properties**
5. Now you can change the properties of the connection by double-clicking on Internet Protocol Version 4 (TCP/IPv4)

6. Mark **Use the following IP address** and enter a custom IP address for your PC. Please note that the network part of the IP address must be identical to the network part to the IP address of the NetBox, i.e., 192.168.0. For the device part, you must use a different address from the NetBox (100); so e.g., 1.

After you have made these settings and connected your PC with the NetBox using an Ethernet cable your PC will establish a point-to-point connection. This procedure can take several minutes.

In the **Network and Sharing Center** your network will now be shown up as a *non-identified network*.

4.3 Remote Access to the NetBox (NetBox Utility)

For a remote access to the NetBox install at first **NetBox Utility** on your PC. You will find the setup program (install.bat) in the folder **NetBox Utility** on your PIX Connect CD. Beside the utility software also the UltraVNC viewer will be installed. You will find this program under **Start/ Programs/ NetBox-UltraVNC**.

After the installation is finished you will find the following icon on your desktop:

Now you can have access to a NetBox which is directly connected to your PC or to a NetBox which is located anywhere in the same network. Also remote connection via the internet is possible.¹⁾

¹⁾ For remote access from outside to a NetBox connected to a company network please ask your system administrator for possibly necessary settings.

Please start NetBox Utility:

Select the desired network adapter and press **Scan**.

The Utility program searches for NetBoxes located in your network or directly connected to your PC. The filter function allows a selective search for NetBoxes only.

Mark the desired NetBox in the window **Results** and press the button **Start Viewer >>**.

The UltraVNC viewer starts now and shows the desktop of the NetBox:

Alternatively, you can scan only a certain IP address range:

Please mark the desired network connection up front.

4.4 File transfer between NetBox and PC

To exchange files between the NetBox and a directly connected or in the network located PC please move the cursor to the title bar of the **UltraVNC Viewer** window and press the right mouse button.

Start **File Transfer**. 

Alternatively, you can also press the following button in the tool bar:

In the following explorer window, you see on the left side your local PC (LOCAL MACHINE) and on the right side the NetBox (REMOTE MACHINE). Now you can copy files between both computers via the network link by marking them and pressing **Send** or **Receive**.

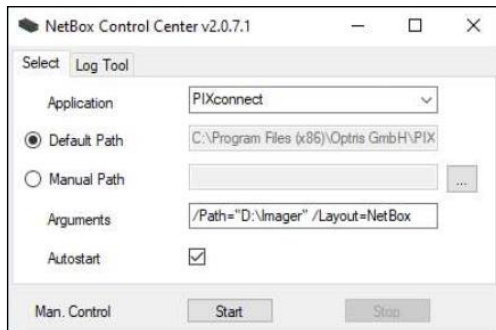

4.5 NetBox Control Center

On the desktop of the NetBox you will find a short cut for the NetBox Control Center:

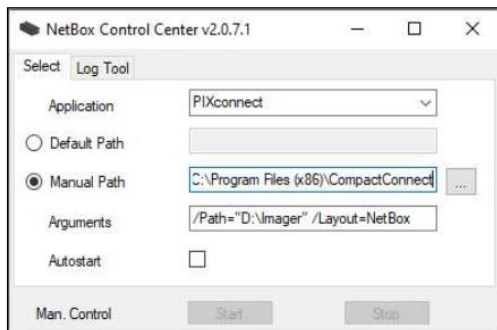

The Control Center allows an easy configuration of the NetBox. On the tab **Select** you can select programs which will be started automatically after starting the NetBox:

At **Application** you can select between PIX Connect and Custom Application.

Application	Operation mode of the NetBox
PIX Connect	Stand-Alone operation
Custom Application	Usage of the NetBox for other applications (example: You can select here the pyrometer software CompactConnect which is already pre-installed on the NetBox.)

As factory default setting the **PIX Connect** will be started by the Control Center.

The start options selected in the Control Center are saved automatically in the NetBox and are available after a restart.

At **Arguments** you can enter command line parameters (a special layout, with which the PIX Connect should start automatically e.g.).

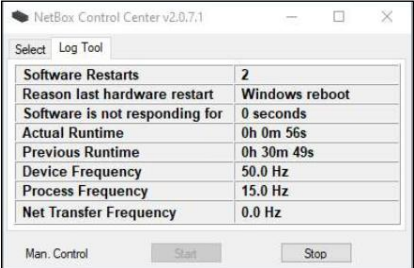

Activate **Autostart** in order to ensure that the selected application will be restarted automatically after a reboot of the NetBox.

If, for any reason, the application is not working properly anymore (software crash), the NetBox Control Center will restart the software automatically (software watchdog) if autostart was selected.

The tab **Log Tool** is giving you the following information:

Software Restarts	Number of software restarts
Reason for last hardware restart	Why the NetBox was restarted the last time
Software is not responding for	Timer, which will be started at non-responding of the software and which is initiating the restart of the selected application
Actual runtime	Current runtime of the software
Previous runtime	Previous runtime of the software
Device Frequency	Camera frame rate
Process Frequency	Processed frame rate (display frame rate)
Net Transfer Frequency	Frame rate transferred via network (at Imager Net Server)

NetBox Control Center v2.0.7.1	
Select	Log Tool
Software Restarts	2
Reason last hardware restart	Windows reboot
Software is not responding for	0 seconds
Actual Runtime	0h 0m 56s
Previous Runtime	0h 30m 49s
Device Frequency	50.0 Hz
Process Frequency	15.0 Hz
Net Transfer Frequency	0.0 Hz
Man. Control	<input type="button" value="Start"/> <input type="button" value="Stop"/>

Information about the image version can be found at the bottom right of the start screen:

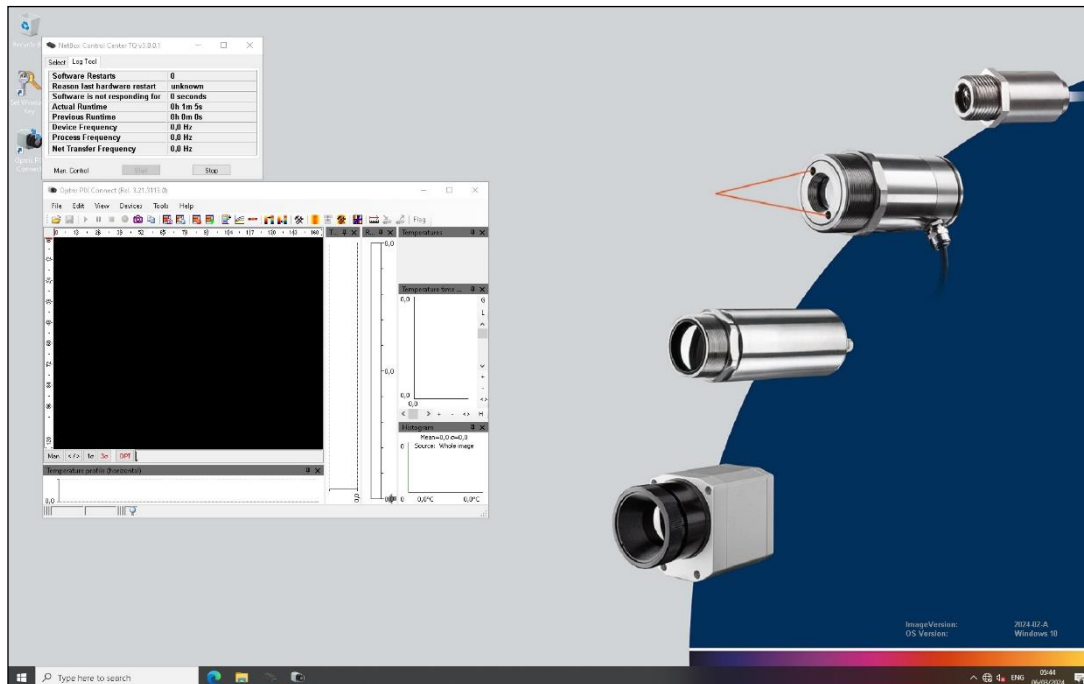

Figure 9: Screen of the NetBox – PIX Connect

4.6 Write Protection Filter

The NetBox has a factory pre-installed write protection filter. This filter is protecting reliably the operating system and the complete drive C and allows a switch-off of the device without a shutdown of the operating system.

The write protection filter is shown as symbol in the task bar.

The colors have the following meaning:

red dot: write mode

green dot: protection mode

The NetBox should be used only with an activated write protection filter [green dot].

To save changed settings or if you want to install additional software the write protection has to be deactivated temporarily. To do this please move the cursor to the green dot in the task bar and push the right

mouse button: Select **Disable write protection and reboot**. **Exit** quits the program and can be returned after a restart the Netbox.

In order to go back to the protected mode select **Enable write protection and reboot**. All changes will be saved and the system will be restarted.

The SSD drive of the NetBox has by factory default two partitions. The write protection refers to partition C only. On the partition D you can save application data. On drive D also the calibration data of the infrared imager are stored.

5 System Information

5.1 Watchdog

If, for any reason, the main software application (**PIX Connect**) does not work properly (software hang-up or crash) or if the main application will be closed, the integrated software watchdog (via the NetBox Control Center) is restarting the program automatically.

For this functionality it is required that the *Autostart* is activated in the **Select Tool**:

Arguments	/Path="D:\Imager" /Layout=NetBox	
Autostart	<input checked="" type="checkbox"/>	
Man. Control	Start	Stop

In addition a hardware watchdog is monitoring the Windows operating system permanently – you see the symbol **[WD]** in the right part of the task bar:

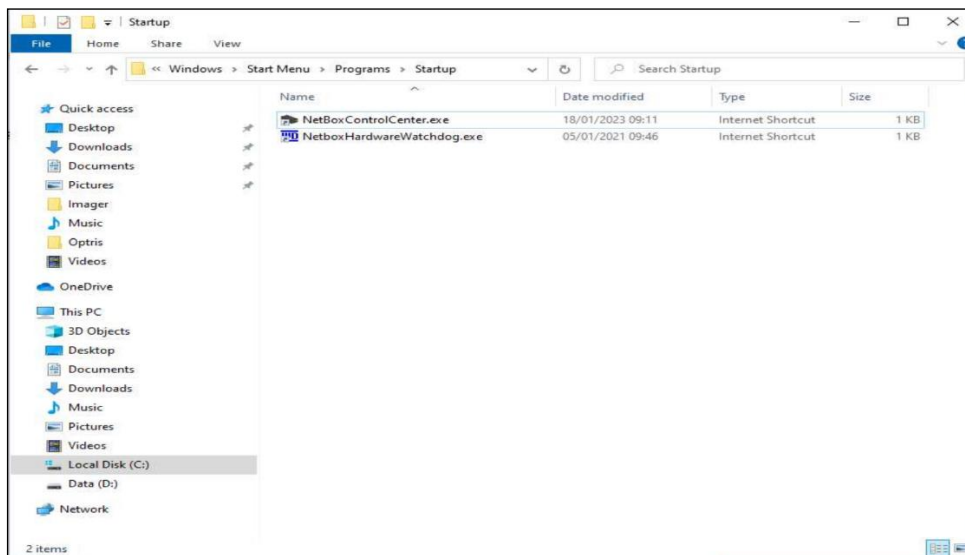

If the watchdog is recognizing a system error or problem it will restart the NetBox automatically.

5.2 Startup

In the Windows Startup folder of the NetBox the following shortcuts are set default:

NetboxControlCenter	starts the program which was selected in the Select Tool
NetboxHardwareWatchdog	starts the hardware watchdog application

5.3 System Time

The NetBox contains a CMOS battery which is used for keeping the system time if the computer is switched off. If a battery change should be necessary please open the battery compartment and exchange by a new battery of the same type (CR1225 or CR1632, depending on production date).

To adapt the NetBox to your local time zone you have to open the Windows date and time setup (Control Panel/ Date and Time).

The NetBox is set by default to UTC+01:00.

To save the new setting permanently you have to deactivate the **► 4.6 Write Protection Filter** temporarily.

5.4 System Recovery

In case a recovery of the Windows operating system of the NetBox is necessary you should use the supplied USB recovery stick. Follow the steps described hereafter. **Do not disconnect power from the NetBox during the recovery procedure.**

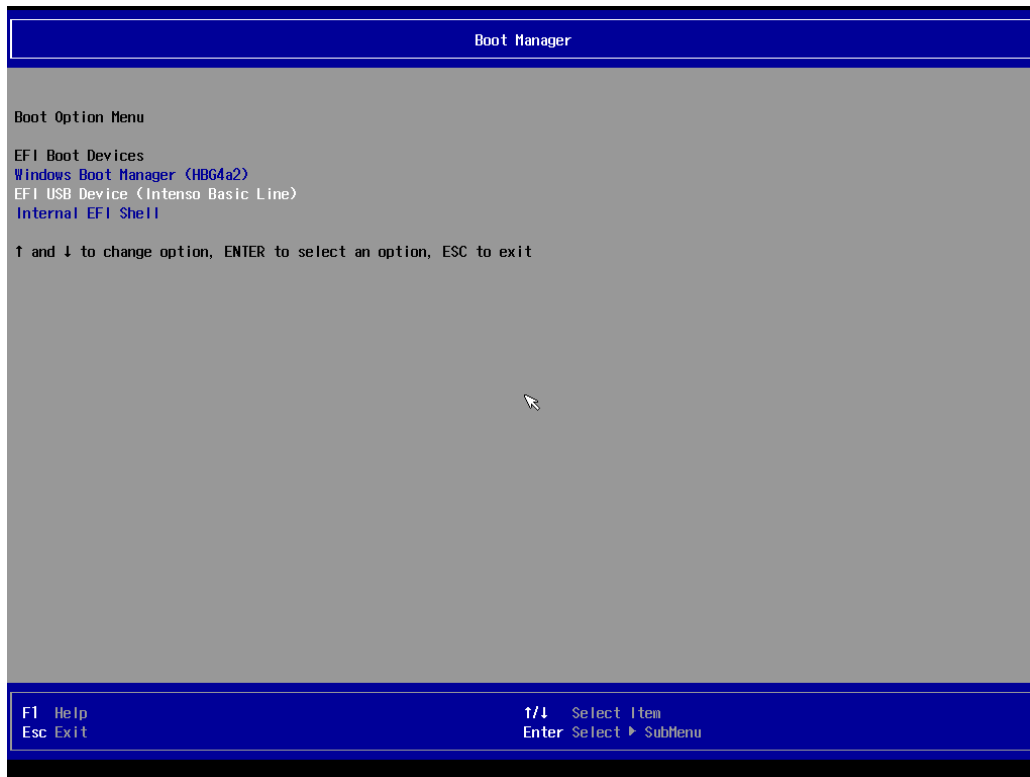

After the system recovery the NetBox has the factory default settings. All data which was stored before on the SSD will get lost.

Connect a monitor and a USB keyboard with the NetBox. Connect the USB Recovery stick to a free USB port of the NetBox and switch on the unit.

Press **Esc** key
during startup until
the following
window appears
and select **Boot
Manager** press
Enter:

In the Boot Manager select **EFI USB Device** and press **Enter**.

GNU GRUB version 2.06-4

*Recovery system : NetBox_22_Nov_2022_TQ (Default settings, VGA 1280x1024)

Use the ↑ and ↓ keys to select which entry is highlighted.
Press enter to boot the selected OS, 'e' to edit the commands before booting or 'c' for a command-line.

Press **Enter** again and wait for the recovery process to complete.

 The system recovery takes about 30 minutes.
